# Unit IV:

## Cross-Platform App Development (Flutter Project)

# Flutter

CTE308- AS2025

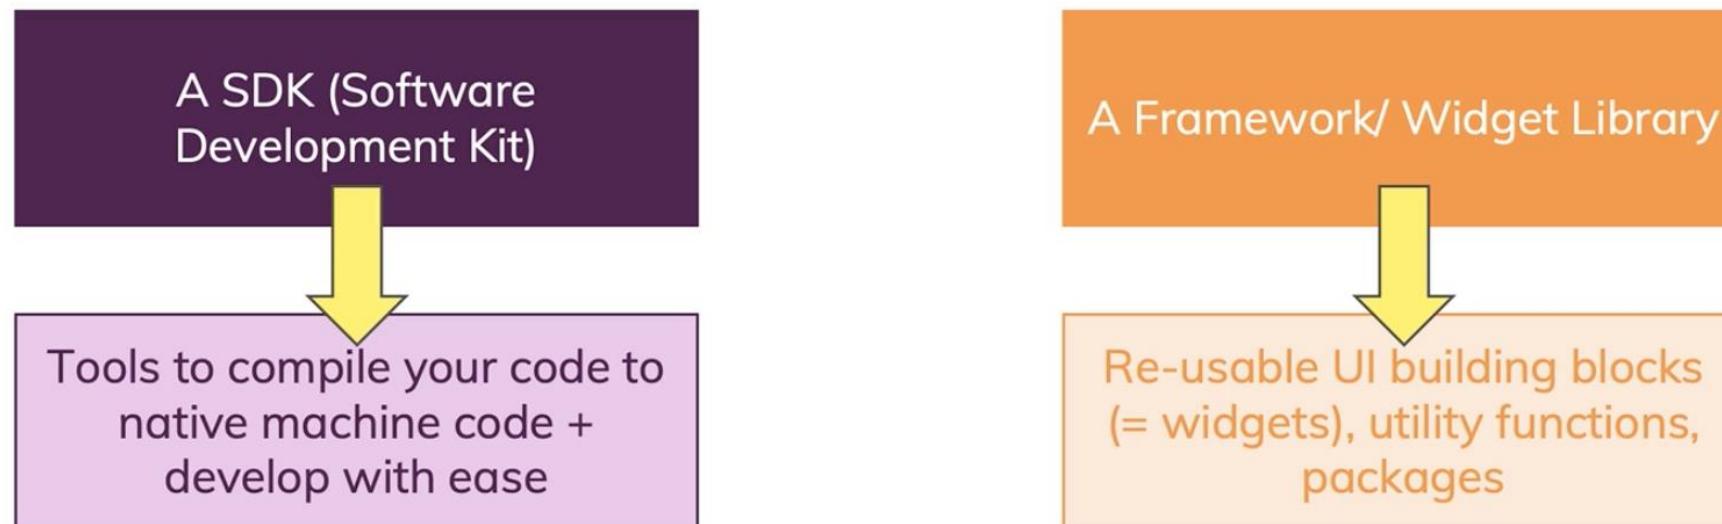

Tutor: Pema Galey  
#17682761

## Outlines

- Flutter Project
- Dart Programming
- Building App from Scratch

## What is Flutter?

- A "tool" that allow you to build native cross-platform (iOS, Android) apps with one programming language and codebase.

## Dart Programming

- Link: [https://dartpad.dev/?null\\_safety=true](https://dartpad.dev/?null_safety=true)

The screenshot shows the DartPad interface. The code editor contains the following Dart code:

```
1 void main() {
2   for (int i = 0; i < 5; i++) {
3     print('hello ${i + 1}');
4   }
5 }
```

A blue "Run" button is positioned to the right of the code editor. To the right of the run button is a "Console" window displaying the output of the program:

```
hello 1
hello 2
hello 3
hello 4
hello 5
```

## Dart Programming

The image displays two side-by-side screenshots of the DartPad web-based development environment. Both screenshots show a dark-themed interface with a top navigation bar featuring 'DartPad' logo, 'New Pad', 'Reset', 'Format', and 'Install SDK' buttons.

**Screenshot 1 (Left):**

- Code:**

```
1 addNumbers(n1, n2){  
2   return n1+n2;  
3 }  
4 void main() {  
5   print(addNumbers(5,6));  
6 }  
7 |
```
- Console Output:** 11

**Screenshot 2 (Right):**

- Code:**

```
1 addNumbers(int n1, int n2){  
2   return n1+n2;  
3 }  
4 void main() {  
5   print(addNumbers(5,6));  
6 }  
7 |
```
- Console Output:** 11

- Case Sensitive

The screenshot shows two separate DartPad sessions side-by-side.

**Top Session:**

```
1 void addNumbers(int n1, int n2){  
2   return n1+n2;  
3 }  
4  
5 void main() {  
6   print(addNumbers(2, 5));  
7 }  
8
```

**Console Output:**

```
Error compiling to JavaScript:  
Info: Compiling with sound null safety  
Warning: Interpreting this as package URI, 'package:dartpad_sample.  
lib/main.dart':12:  
Error: C  
      return
```

**Bottom Session:**

```
1 int addNumbers(int n1, int n2){  
2   return n1+n2;  
3 }  
4  
5 void main() {  
6   print(addNumbers(2, 5));  
7 }  
8
```

**Console Output:**

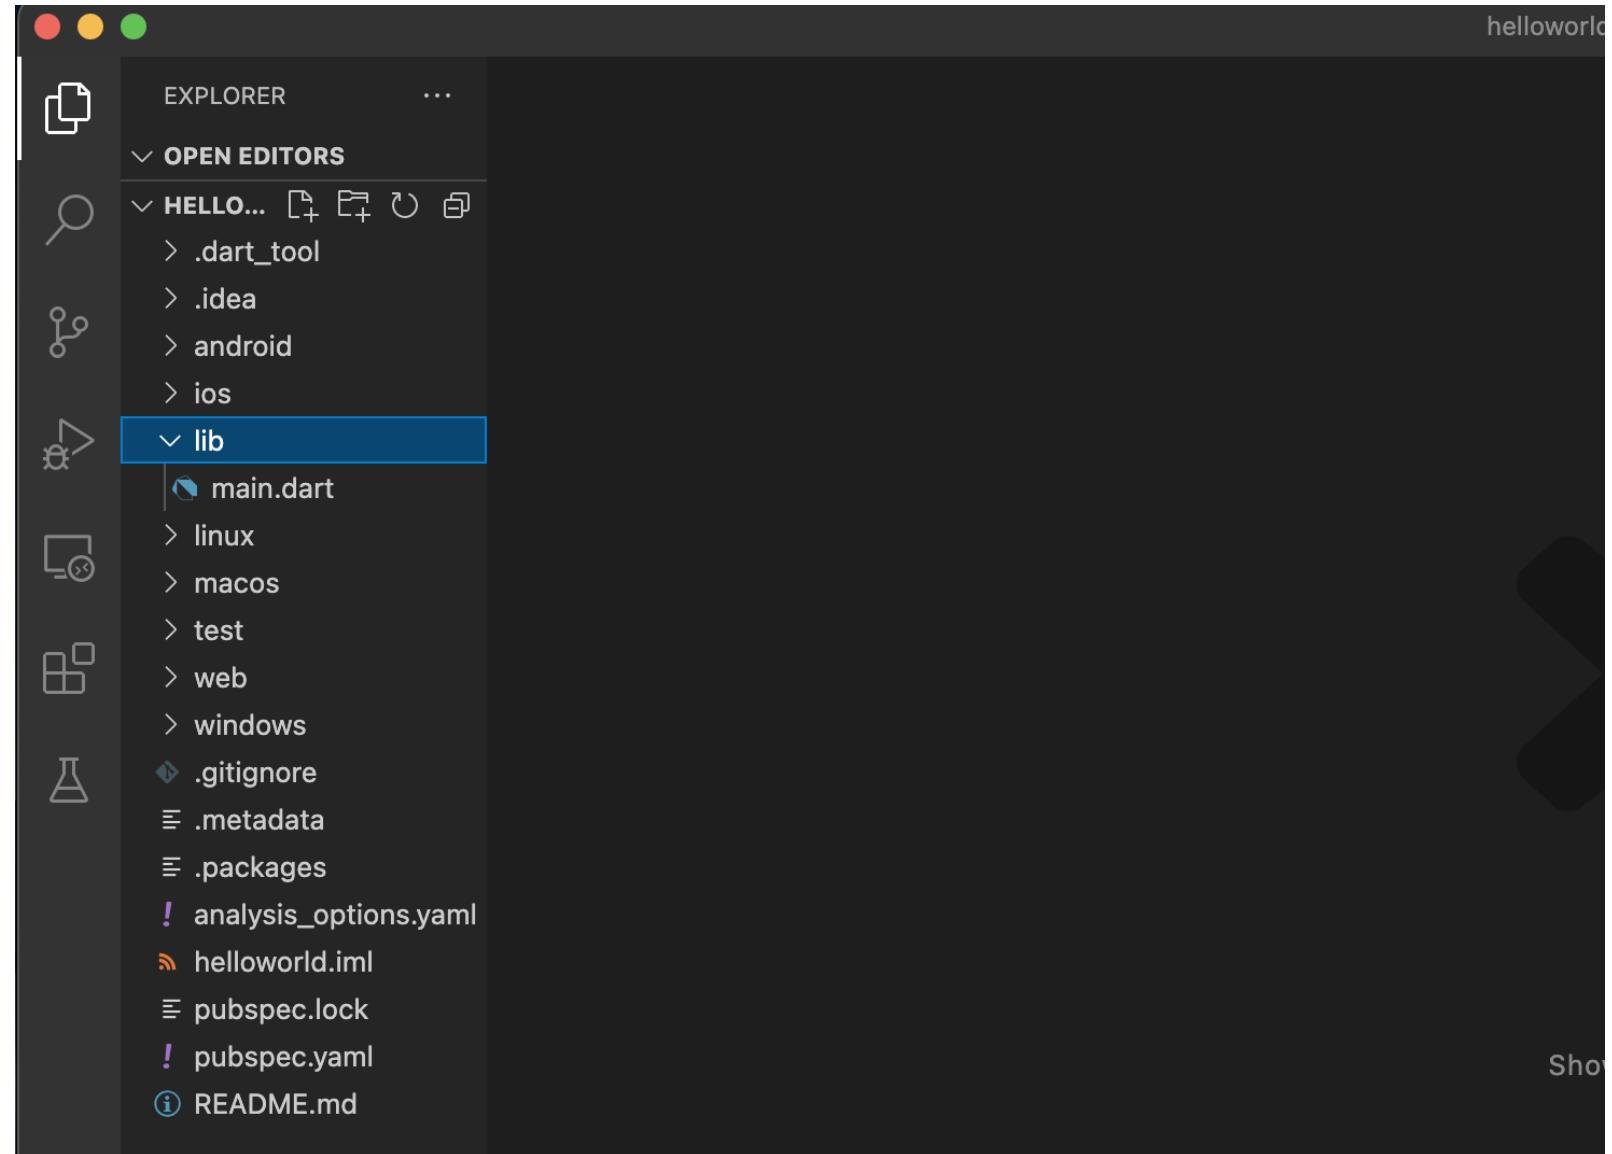

```
7
```

## Create Flutter Project

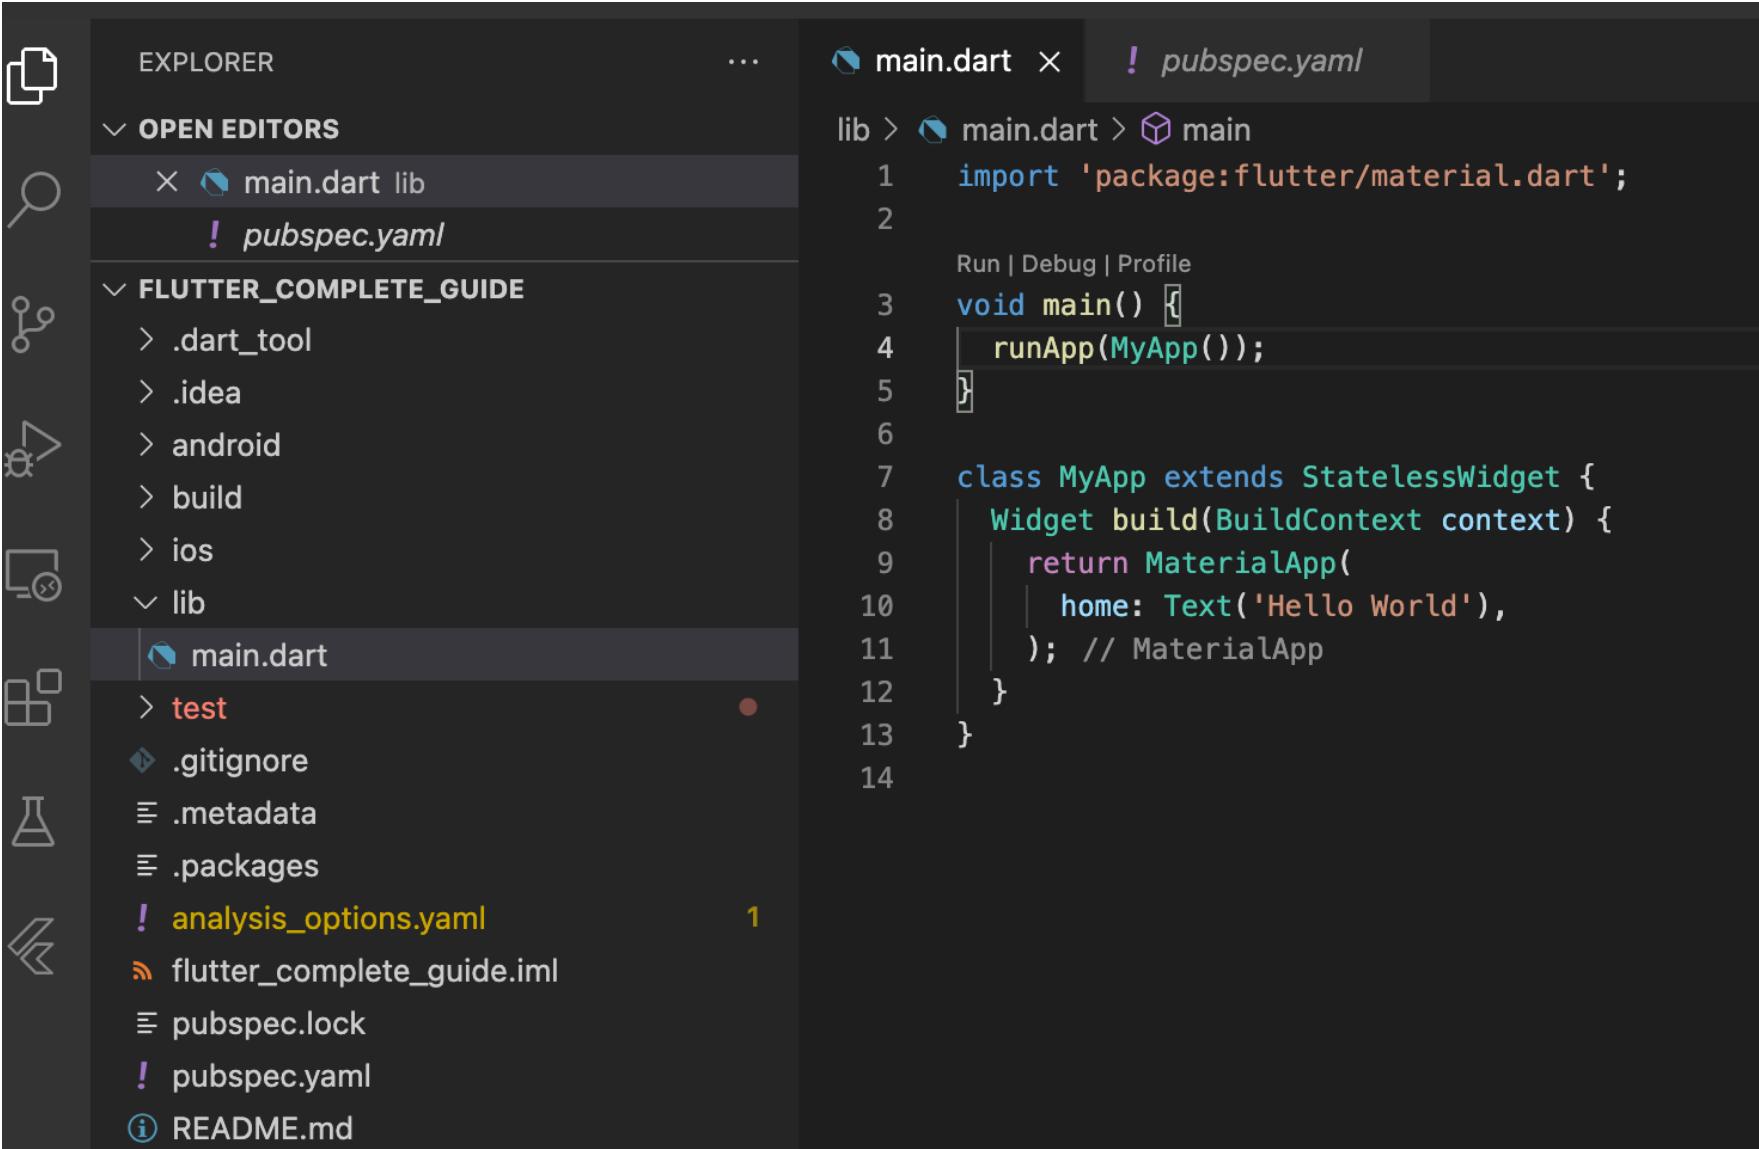

- **Create and run a simple Flutter app**

1. Create a new Flutter app by running the following from the command line:
  - `flutter create my_app`
2. A `my_app` directory is created, containing Flutter's starter app. Enter this directory:
  - `cd my_app`
3. To launch the app in the Simulator, ensure that the Simulator is running and enter:
  - `flutter run`

# Flutter Project

## Creating basic App

The screenshot shows a code editor interface with the following details:

- EXPLORER View:** Shows the project structure:
  - lib > main.dart
  - ! pubspec.yaml
  - FLUTTER\_COMPLETE\_GUIDE folder
    - .dart\_tool
    - .idea
    - android
    - build
    - ios
    - lib
      - main.dart
    - test
    - .gitignore
    - .metadata
    - .packages
    - ! analysis\_options.yaml
    - flutter\_complete\_guide.iml
    - pubspec.lock
    - ! pubspec.yaml
    - README.md
- main.dart Editor:** Displays the Dart code for the application's entry point.

```
import 'package:flutter/material.dart';

void main() {
  runApp(MyApp());
}

class MyApp extends StatelessWidget {
  Widget build(BuildContext context) {
    return MaterialApp(
      home: Text('Hello World'),
    ); // MaterialApp
  }
}
```

## Basic Design

```
Run | Debug | Profile
void main() {
    runApp(MyApp());
}

// void main() => runApp(MyApp());

class MyApp extends StatelessWidget {
    @override
    Widget build(BuildContext context) {
        return MaterialApp(
            home: Scaffold(
                appBar: AppBar(
                    title: Text('First App'),
                ), // AppBar
                body: Text('Hello, this is my deafault'),
            ), // Scaffold
        ); // MaterialApp
    }
}
```

# WIDGETS

Output & Input (Visible)

RaisedButton(), Text(), Card(), ...

Layout & Control (Invisible)

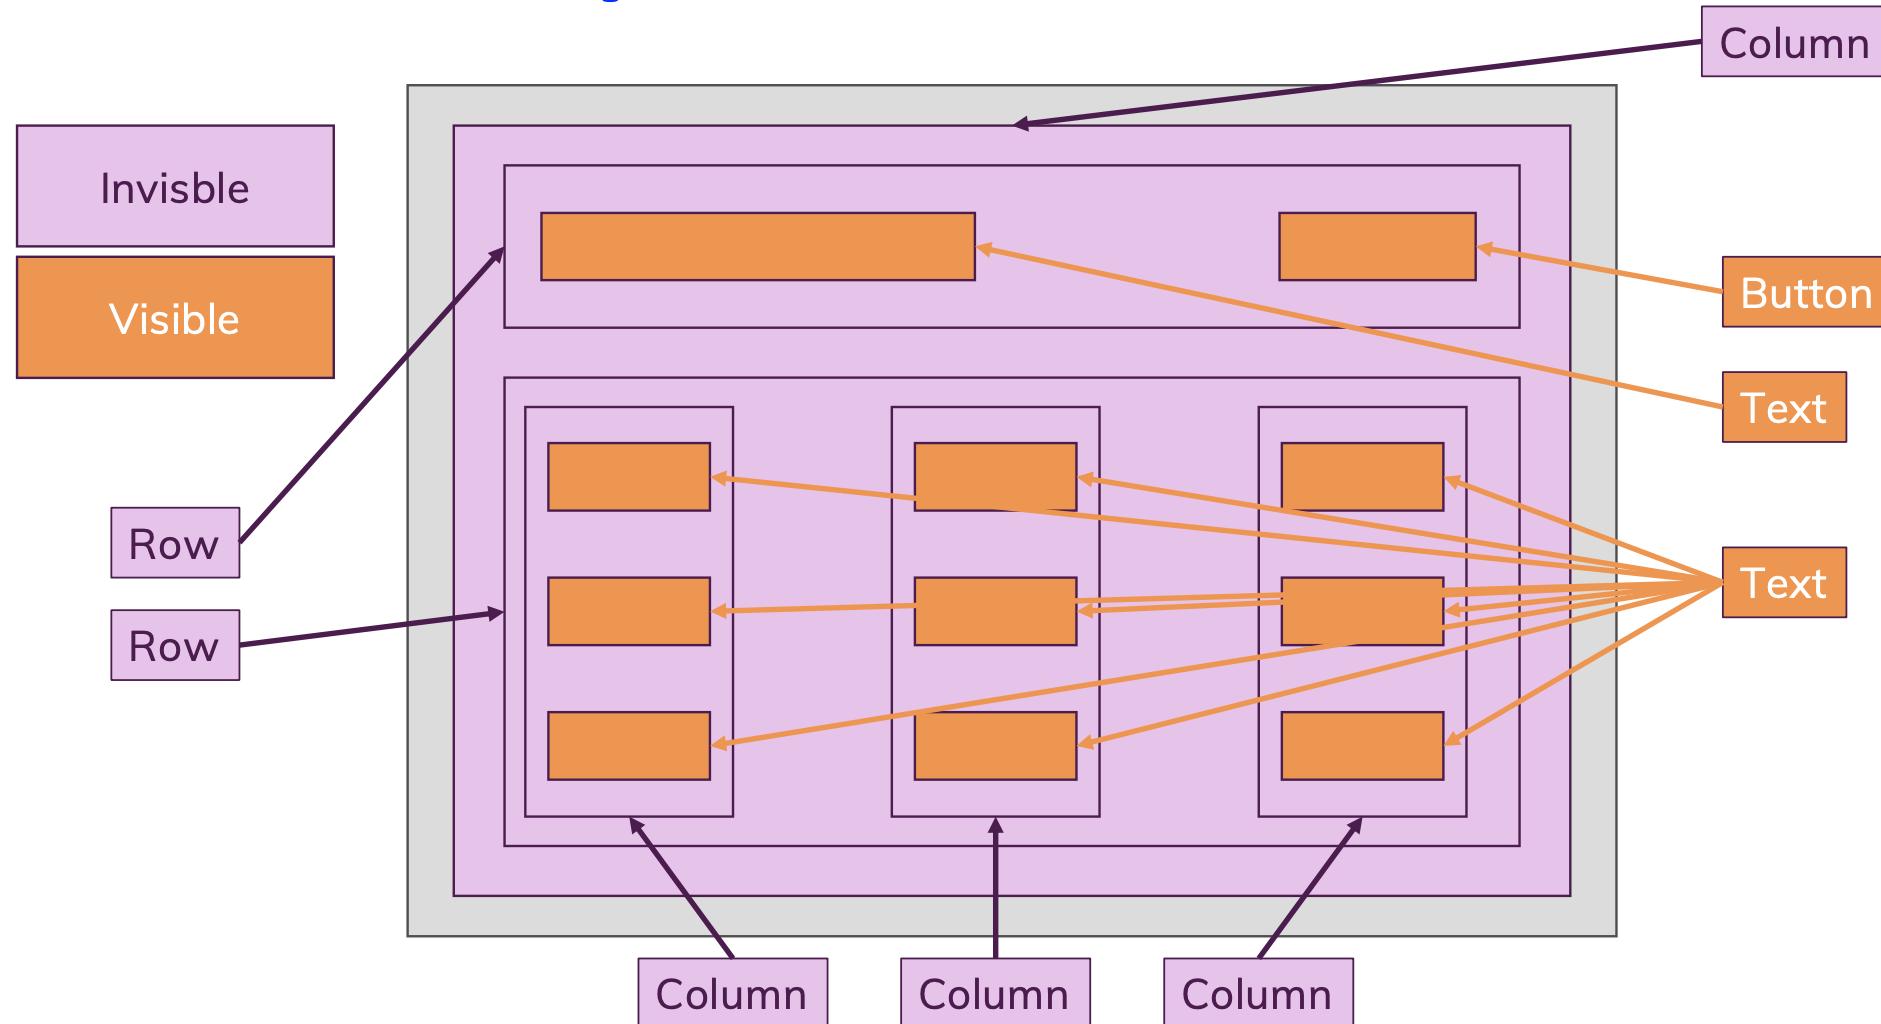

Row(), Column(), ListView(), ...

Container()

Drawn onto the screen: “What the user sees”

Give your app structure and control how visible widgets are drawn onto the screen (incirectly visible)

# VISIBLE/INVISIBLE WIDGETS

## TUTORIAL LINK

- <https://www.youtube.com/watch?v=x0uinJvhNxI>
- <https://dit.udemy.com/course/learn-flutter-dart-to-build-ios-android-apps/>

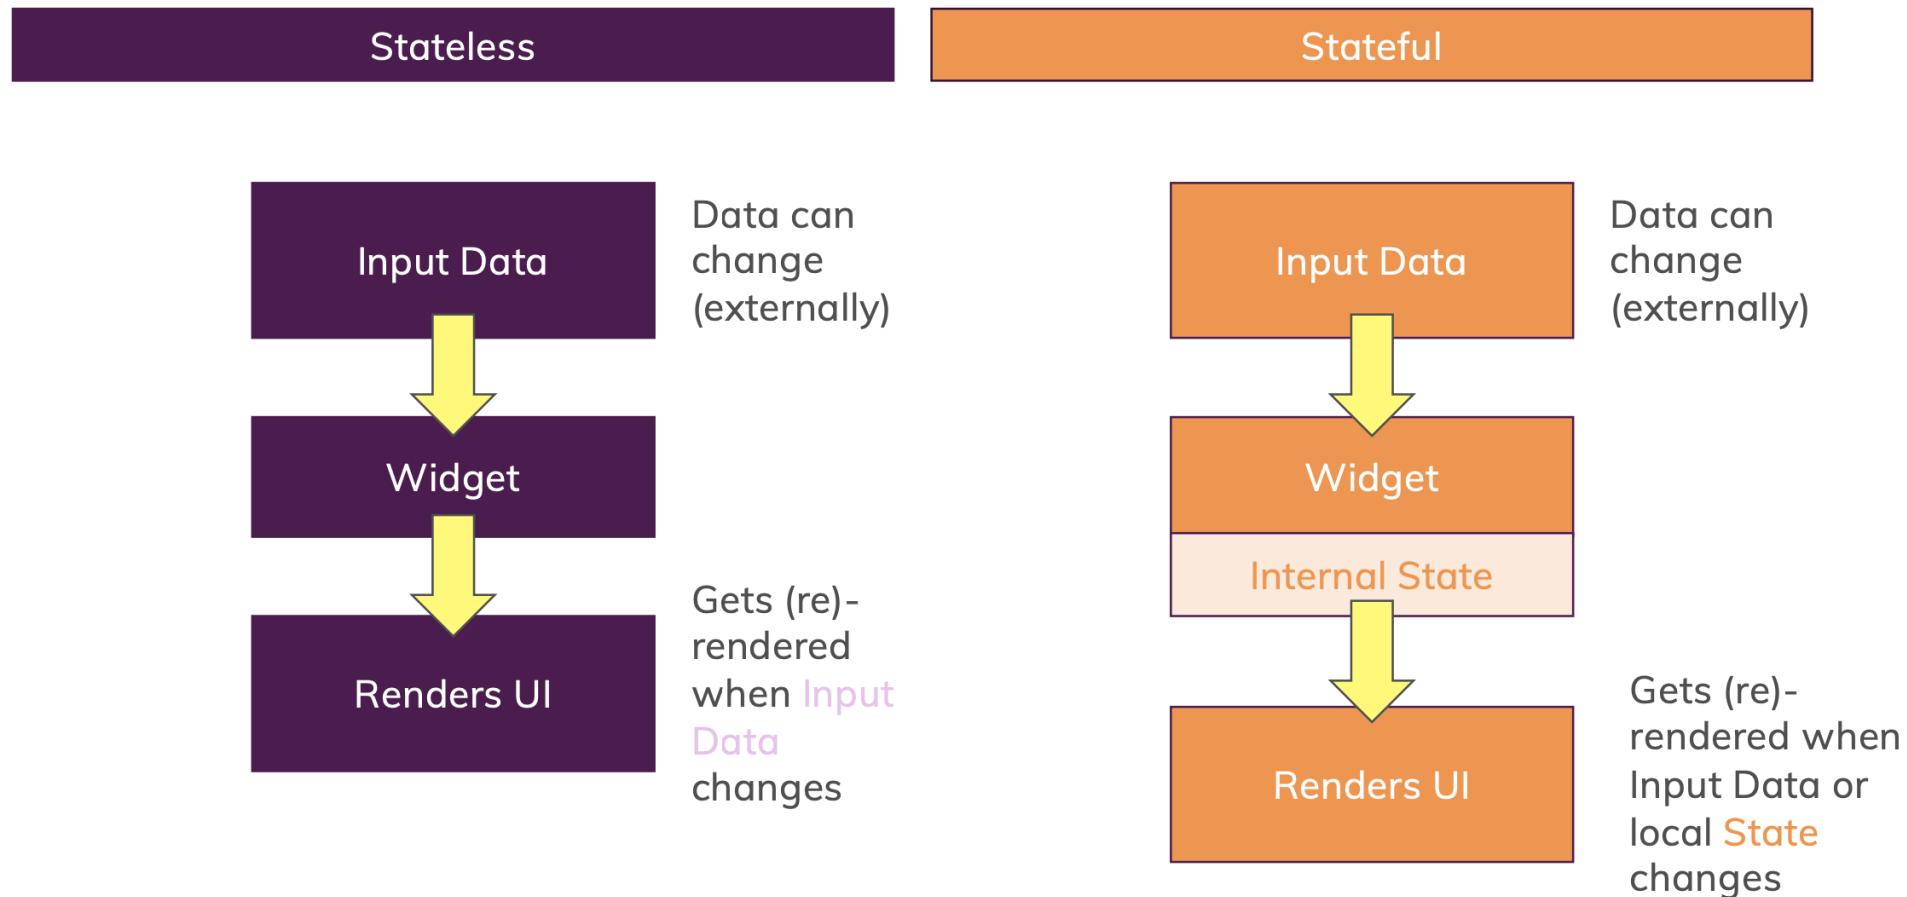

## ADDING MORE WIDGETS

```
class MyApp extends StatelessWidget {  
    @override  
    Widget build(BuildContext context) {  
        var questions = [  
            'What is your name?',  
            'Where are you from?',  
        ];  
        return MaterialApp(  
            home: Scaffold(  
                appBar: AppBar(  
                    title: Text('First App'),  
                ), // AppBar  
                // body: Text('Hello, this is my deafault'),  
                body: Column(  
                    children: [Text('Questions'),  
                        RaisedButton(child: Text('Answer 1'), onPressed: null,),  
                        RaisedButton(child: Text('Answer 2'), onPressed: null,),  
                        RaisedButton(child: Text('Answer 3'), onPressed: null,),  
                    ],  
                ), // Column  
            ), // Scaffold  
        ); // MaterialApp  
    }  
}
```

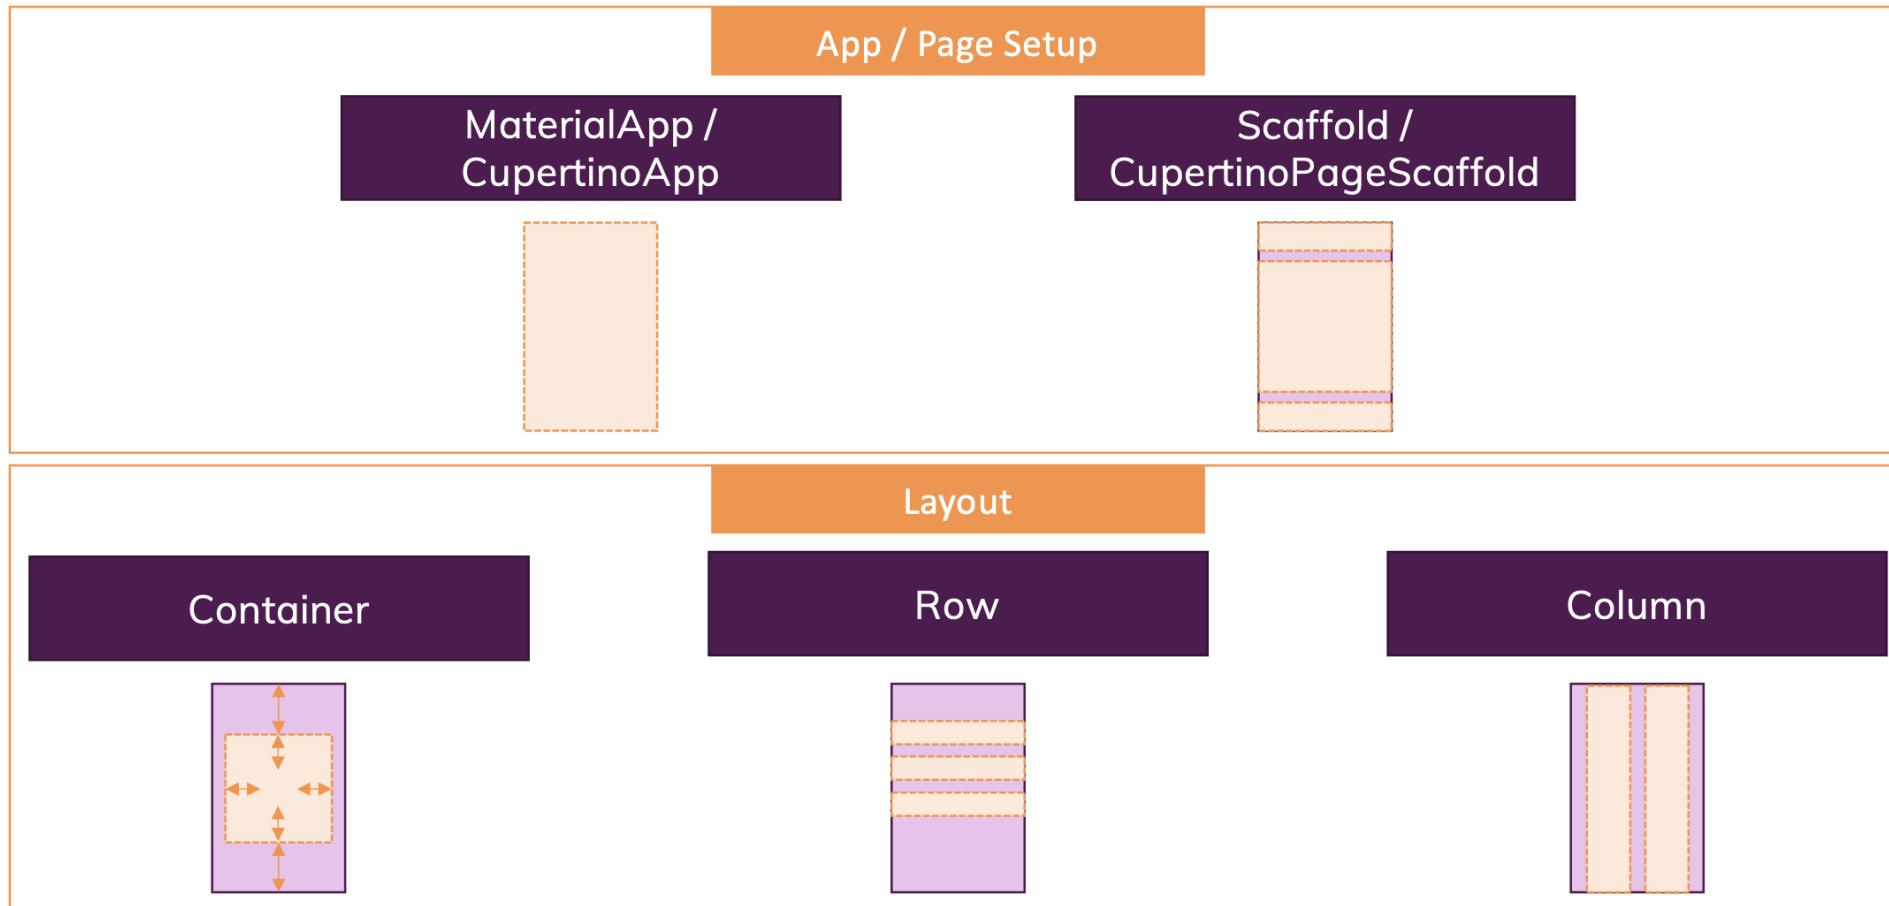

## RaisedButton deprecated

```
main.dart > MyApp > build
5 }
6
7 class MyApp extends StatelessWidget {
8     // This widget is the root of your application.
9     @override
10    Widget build(BuildContext context) {
11        var questions = ['what is your name?', 'Where are you from?'];
12        return MaterialApp(
13            home: Scaffold(
14                appBar: AppBar(
15                    title: Text("Hello World"),
16                ), // AppBar
17                body: Column(
18                    children: [
19                        Text('Questions'),
20                        ElevatedButton(onPressed: null, child: Text('Answer1')),
21                        ElevatedButton(onPressed: null, child: Text('Answer2')),
22                        ElevatedButton(onPressed: null, child: Text('Answer3')),
23                    ],
24                ), // Column
25            ), // Scaffold
26        ); // MaterialApp
27    }
28}
```

# STATELESS & STATEFUL

# Widgets

## Details

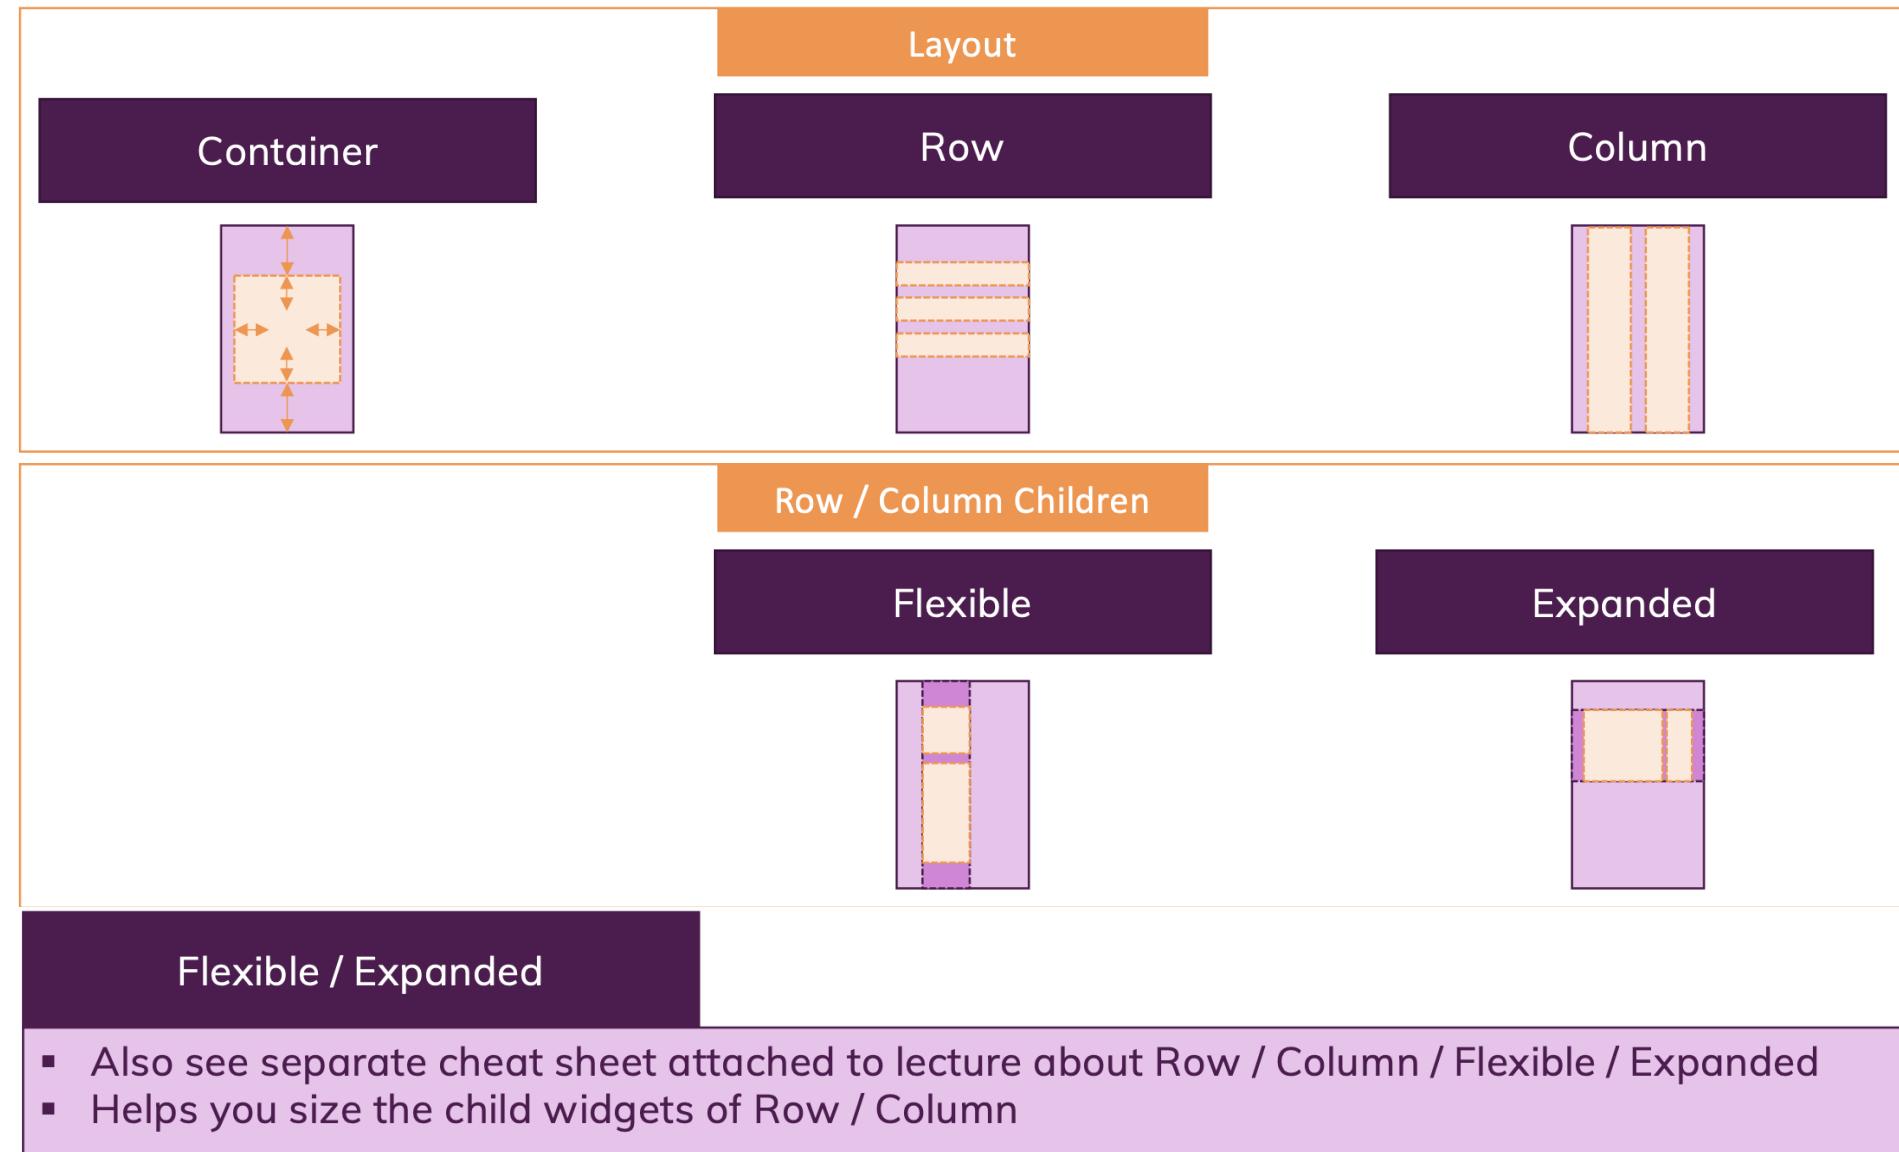

### Container

- Extremely versatile widget!
- Can be sized (width, height, maxWidth, maxHeight), styled (border, color, shape, ...) and more
- Can take a child (but doesn't have to) which you also can align in different ways
- You'll use this widget quite often

### Row / Column

- Must-use if you need multiple widgets sit next to each other horizontally or vertically
- Limited styling options => Wrap with a Container (or wrap child widgets) to apply styling
- Children can be aligned along main-axis and cross-axis (see separate cheat sheet)

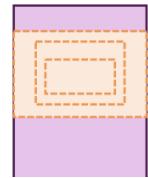

## Widgets

## Widgets

### Content Containers

Stack

Card

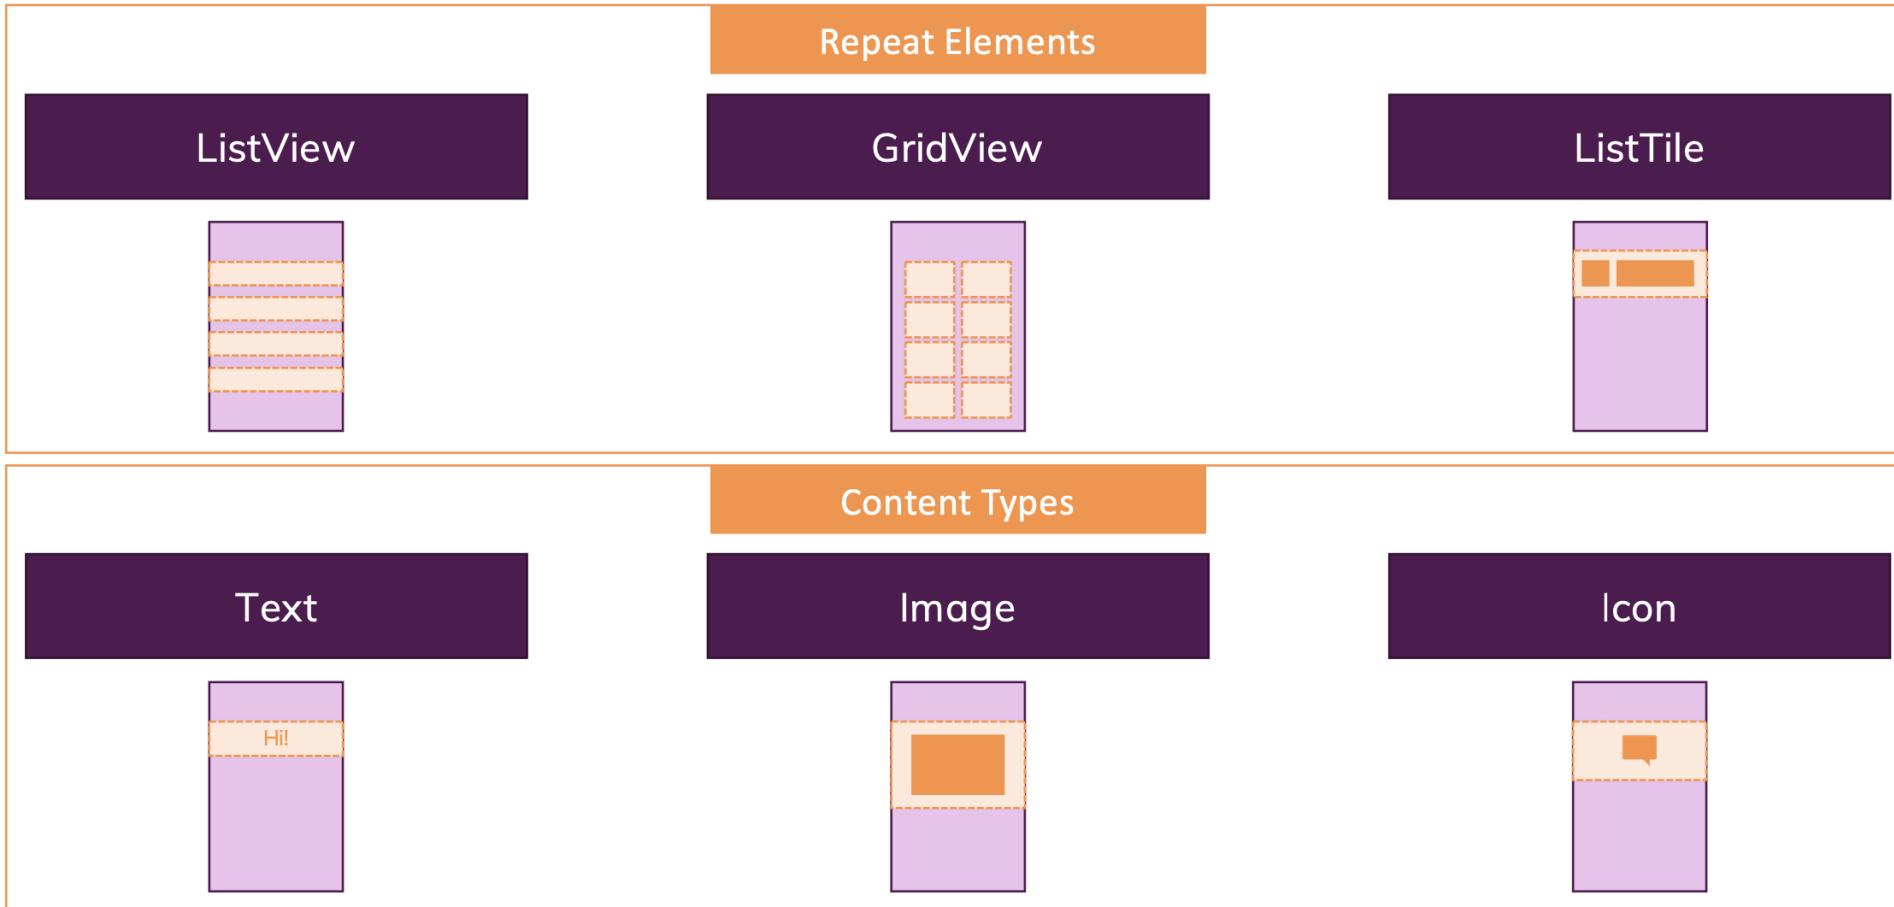

Stack

- Used to position items on top of each other (along the Z axis)
- Widgets can overlap
- You can position items in absolute space (i.e. in a coordinate space) via the Positioned() widget

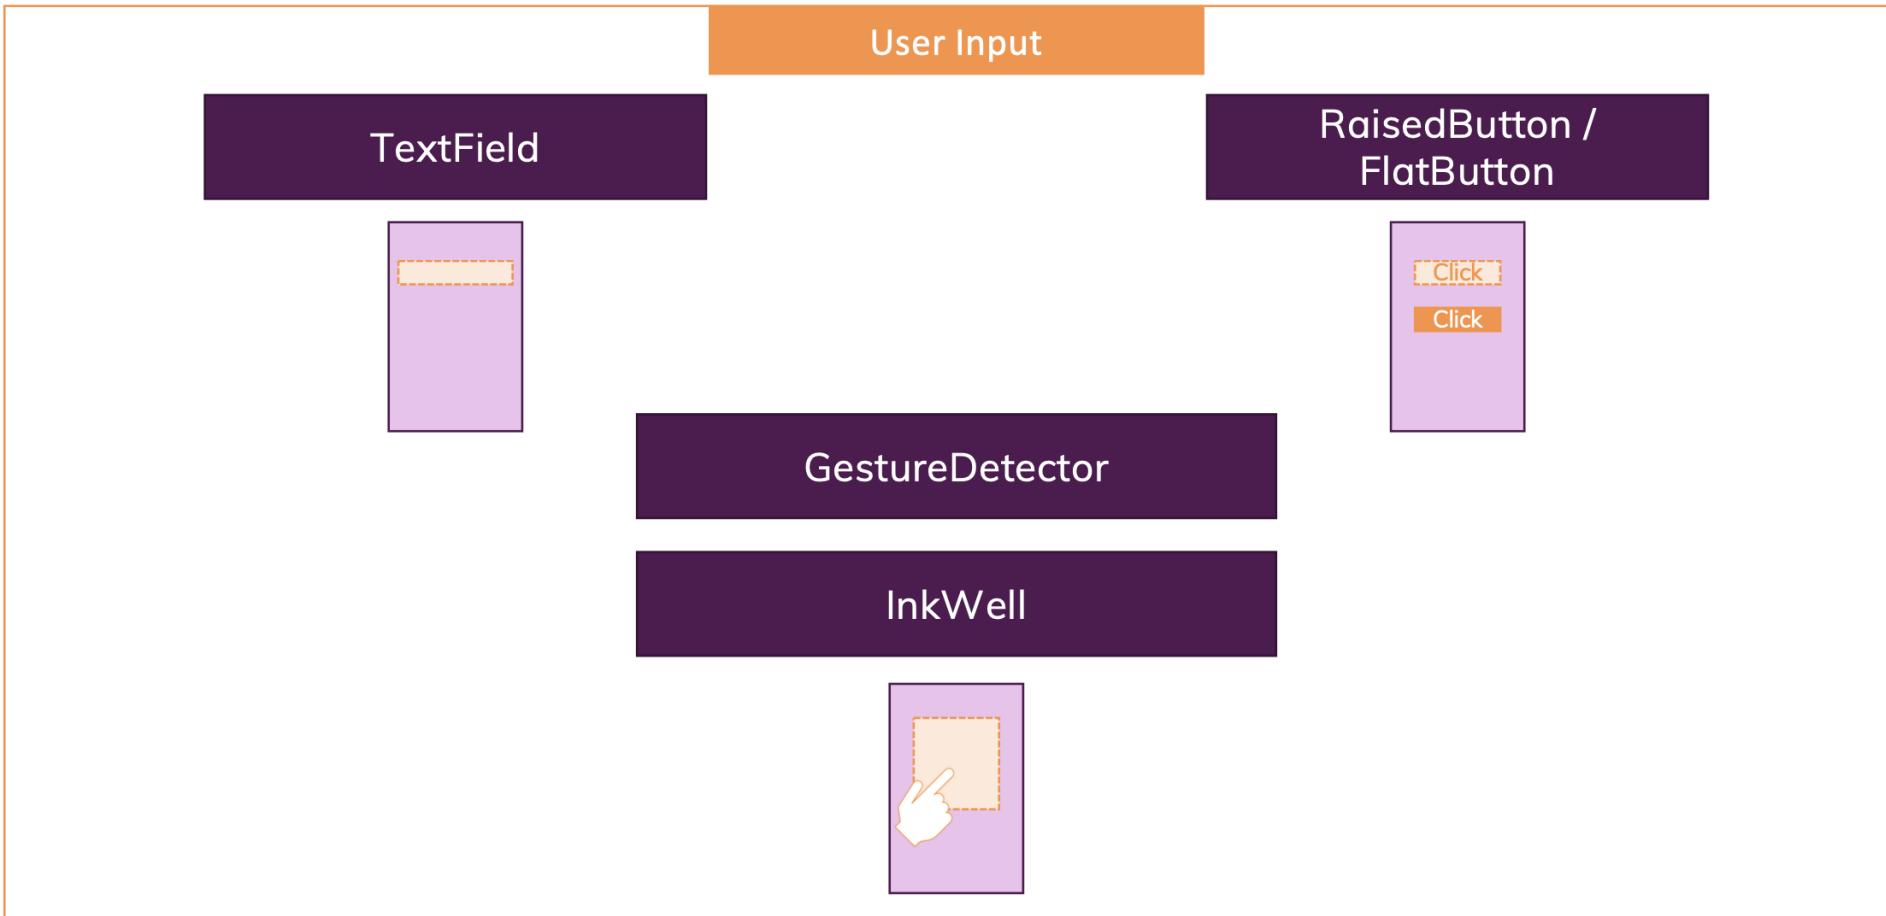

Card

- A container with some default styling (shadow, background color, rounded corners)
- Can take one child (can be anything)
- Typically used to output a single piece / group of information

# WIDGETS

# WIDGETS

- Data – Persistence
- Read-Write File
- SQLite

## Data - Persistence

### Store Key-Value on disk

- If you have a relatively small collection of key-values to save, you can use the shared\_preferences plugin.
- The shared preferences plugin wraps NSUserDefaults on iOS and SharedPreferences on Android.
- This recipe uses the following steps:
  - Add the dependency
  - Save data
  - Read data
  - Remove data

## Data - Persistence

### Store Key-Value on disk

1. Add the dependency.
- Before starting, add the shared\_preferences package as a dependency using flutter pub add:  
  
• **flutter pub add shared\_preferences**

## Data - Persistence

### □ Store Key-Value on disk

- 2. Save Data

- To persist data, use the setter methods provided by the SharedPreferences class. Setter methods are available for various primitive types, such as setInt, setBool, and setString.
- synchronously update the key-value pair in-memory.

```
• // obtain shared preferences
• final prefs = await SharedPreferences.getInstance();

• // set value
• await prefs.setInt('counter', counter);
```

## Data - Persistence

### □ Store Key-Value on disk

- 3. Read Data

- To read data, use the appropriate getter method provided by the SharedPreferences class. For each setter there is a corresponding getter. For example, you can use the getInt, getBool, and getString methods.
- ```
final prefs = await SharedPreferences.getInstance();
```
- ```
// Try reading data from the counter key.
```
- ```
// If it doesn't exist, return 0.
```
- ```
final counter = prefs.getInt('counter') ?? 0;
```

## Data - Persistence

### □ Store Key-Value on disk

#### • 4. Remove Data

- To delete data, use the remove() method..
- `final prefs = await SharedPreferences.getInstance();`
- `await prefs.remove('counter');`

## Data - Persistence

- Read-Write Files
- Persist data with SQLite

## Beyond UI

- Data and Backend
- Platform Integration
- Packages and Plugins
- Testing and Debugging
- Performance and Optimization
- Deployment
- Add to an existing app

## Data and Backend

- ✓ The state management – level of app development stages
- ✓ Networking and HTTP:
  - ✓ Fetch data from the internet
  - ✓ Make authenticated requests
  - ✓ Send data to the internet
  - ✓ Perform CRUD of data over the internet
- ✓ Data Serialization
  - ✓ JSON Serialization

## Data and Backend

- ✓ Persistence – Date storage using key-value pair
  - ✓ How to add, read and remove data from the local disk using Shared Preferences concept.
- ✓ Read and Write data to files
- ✓ Persist data with SQLite
  - ✓ If you have large amounts of data on the local device, consider using a database. Databases provide faster CRUD functions.
- ✓ Firebase - Backend-as-a-Service (BaaS)
- ✓ Google APIs

## Platform Integration

- ✓ The Support Tiers
  - ✓ **Supported** - Google-tested platforms that are automatically tested on every commit by continuous integration testing.
  - ✓ **Best effort** - Platforms that we intend to support through coding practices, but are only tested on an ad-hoc basis.
  - ✓ **Unsupported** - Platforms that we don't test or support.
- ✓ How to write platform-specific code? There is an automatic platform adaptation as well.
- ✓ Apps for Android, iOS, Linux, macOS, Web and Windows

## Packages and Plugins

- ✓ Flutter supports using shared packages contributed by other developers to the Flutter and Dart ecosystems.
- ✓ This allows quickly building an app without having to develop everything from scratch.
- ✓ A plugin is a type of package—the full designation is plugin package, which is generally shortened to plugin.

## Testing and Debugging

- **Testing:**
  - ✓ The more features your app has, the harder it is to test manually.
  - ✓ Automated tests help ensure that your app performs correctly before you publish it, while retaining your feature and bug fix velocity.
  - ✓ Automated testing falls into a few categories:
    1. A *unit test* tests a single function, method, or class.
    2. A *widget test* (in other UI frameworks referred to as component test) tests a single widget.
    3. An *integration test* tests a complete app or a large part of an app.

## Testing and Debugging

- **Debugging:**

- ✓ There's a wide variety of tools and features to help debug Flutter applications. Here are some of the available tools:
  - ✓ **DevTools**, a suite of performance and profiling tools that run in a browser.
  - ✓ **Android Studio/IntelliJ, and VS Code** (enabled with the Flutter and Dart plugins) support a built-in source-level debugger with the ability to set breakpoints, step through code, and examine values.
  - ✓ **Flutter inspector**, a widget inspector available in DevTools, and also directly from Android Studio and IntelliJ

## Performance and Optimization

- ✓ What is performance? Why is performance important? How do I improve performance?
- ✓ To improve performance, you first need metrics: some measurable numbers to verify the problems and improvements.
  - ✓ Startup time to the first frame
  - ✓ Statistics of frame
  - ✓ CPU/GPU usage (a good approximation for energy use)
- ✓ Speed of your app - Are your animations janky (not smooth)?
- ✓ App Size - How to measure your app's size. The smaller the size, the quicker it is to download.
- ✓ Rendering animations in your app is one of the most cited topics of interest when it comes to measuring performance.

# Thank you!
